

I think I focused on making a design that would be time-efficient, so I ended up spending a lot longer than I think I needed to on the design at first. I could've just tried something that I thought was decent at first and changed my design a bit as I continued the homework. Then for writing tests, I think I should've probably had a more structured way of writing tests, like maybe writing down edge cases as I wrote out the specs and making sure I wrote something for regular tests, error tests, etc. Since I didn't do that, I spent much longer than I needed to on writing tests since I kept getting tired of doing it.

TAs and mentors are doing great, thanks for helping in the discord and DMs :)

I now am more sure of what an ADT is
